### Acknowledgments

This report presents a summary of the employment characteristics of Ph.D. scientists and engineers employed in business and industry in 1973 and 1977. The report is based on the results of the 1973 and 1977 Surveys of Doctorate Recipients (SDR) which were conducted under the auspices of the Commission on Human Resources (CHR) of the National Research Council. Support for the project was provided by the National Science Foundation.

Betty D. Maxfield, Project Director of the SDR, and Andrew W. Spisak, Research Associate, were responsible for the development of the report outline, compilation of the summary statistics, and the drafting of the final report. Courtney Knauth, technical editor to the project staff, provided assistance in making final emendations. Roberta Douglas, Project Secretary, was responsible for checking the statistics presented in the report and for setting up the format for the final report.

John Coltman served as the principal reviewer for the Commission, and along with J. James Brown and John Scopino of the National Science Foundation, provided helpful suggestions for clarification of the text of the report.

William C. Kelly, Executive Director of the Commission on Human Resources, provided administrative assistance and policy guidance to the SDR staff. Lindsey Harmon and Dorothy Gilford, CHR staff members, reviewed the first draft of the report and provided a number of helpful suggestions for additional analyses.

The doctorate recipients who responded to the 1973 and 1977 Surveys of Doctorate Recipients deserve much gratitude for the cooperation and assistance that made this report possible.

# Highlights

Business and industry currently ranks as the second largest employer of doctoral scientists and engineers (S/E), employing 25 percent of the S/E Ph.D.'s in 1977 compared with 57 percent employed by educational institutions. While the number of S/E Ph.D.'s in the U.S. labor force increased by approximately 28 percent between 1973 and 1977 (from 218,000 to 280,200), the number of S/E Ph.D.'s working in business and industry increased 34 percent (from 52,900 to 70,600) during the same period of time.

• For those doctoral scientists and engineers who were part of the U.S. labor force in both 1973 and 1977, the percentage employed in business and industry increased from 23.7 percent to 25.6 percent, while the percentages employed in educational institutions and government declined.

• By field of doctorate, newly graduated computer science Ph.D.'s showed the greatest increase in business and industry employment between 1973 and 1977. While less than 25 percent of the FY1972 Ph.D.'s entered business and industry in 1973, nearly 60 percent of the FY1976 computer science Ph.D.'s were employed in the business sector in 1977.

• Women scientists are still a small part of the scientific labor force employed in business and industry, but their numbers are growing. The percentage of women S/E Ph.D.'s employed in business and industry increased between 1973 and 1977 from 2.5 percent to 4.0 percent. The percentage of women in the employed S/E doctoral population in 1977 was 9.5 percent.

• In 1977 nearly 60 percent of the industry-employed S/E Ph.D.'s had degrees in either chemistry or engineering compared with approximately 30 percent of the total employed S/E Ph.D. population.

• In comparison with the total employed S/E Ph.D. population, slightly higher percentages of those employed in business and industry were foreign citizens (8.0 percent versus 6.0 percent) or members of racial minority groups (9.0 percent versus 6.6 percent).

• Over 70 percent of the Ph.D.'s working in business and industry in 1973 and 1977 were employed in manufacturing businesses, with 25 percent working in chemical and allied products alone. However, for those Ph.D.'s working in the psychology field, two out of every three were self-employed in 1977.

• More than 40 percent of industry-employed doctoral scientists and engineers were engaged in research and development in 1973 and 1977. In comparison with men, women were more frequently engaged in basic research and less frequently in development.

• Although management and administration was the second most frequent work activity for the employed S/E doctoral population, only 13.5 percent of the women compared with 37.8 percent of the men in 1973, and 11.8 percent of the women compared with 34.6 percent of the men in 1977, held positions as managers or administrators. Women were more frequently self-employed than men, 37.6 percent compared with 7.3 percent for men in 1973 and 38.9 percent compared with 8.5 percent for men in 1977.

• Nearly 60 percent of the industry-employed S/E Ph.D.'s whose work was federally supported in 1977 devoted a significant proportion of their professional time to national defense or energy and fuel. The areas to which scientists and engineers who received no funding from the U.S. government devoted large portions of their professional time were energy and fuel or health.

• Nearly half of all federally funded S/E Ph.D.'s received at least part of their support from the Department of Defense (DOD), of which the highest percentages were working for companies involved primarily in the manufacturing of transportation equipment or electrical and communications equipment.

• One-third of those Ph.D.'s receiving funding from the Department of Health, Education, and Welfare (DHEW) were self-employed; two-thirds of whom were in the field of psychology.

• Salaries of Ph.D.'s employed in business and industry failed to keep pace with inflation between 1973 and 1977. The median annual salary of all S/E Ph.D.'s employed full-time in business and industry increased nearly 29 percent between 1973 and 1977; the consumer price index for the same period increased approximately 38 percent.

• The median annual salary estimates for the fulltime employed S/E Ph.D.'s in business and industry were \$23,200 in 1973 and \$29,900 in 1977 as contrasted with median academic salaries of \$19,100 in 1973 and \$23,600 1977. The self-employed S/E Ph.D.'s had the highest median salary in both 1973 (\$30,200) and 1977 (\$32,400). Ph.D.'s working in petroleum and refining businesses had the next highest median annual salary in 1977 (\$32,000). Ph.D. employees of non-classifiable companies had the lowest median salary in 1977 (\$25,900).

• By primary work activities, the highest median annual salaries in business and industry in 1977 were estimated for managers and administrators (\$34,600) and those providing professional service (\$35,200).

• By field, Ph.D.'s working in psychology had the highest estimated median annual salaries in both 1973 (\$30,000) and 1977 (\$33,600).

• In 1977, the S/E Ph.D.'s in business and industry who had the highest proportion of employment in the same fields as their doctoral fields were computer scientists (92.3 percent) and psychologists (88.4 percent). Ph.D. recipients who were least likely to be employed in the same fields as their degrees were mathematicians (36.6 percent remaining in field), physicists and astronomers (40.7 percent), biological scientists (41.4 percent), and social scientists (48.9 percent). Mathematics and physics doctorates gravitated principally to engineering and computer sciences.

• Of the S/E Ph.D.'s employed in business and industry in both 1973 and 1977 over 80 percent reported that they worked in the manufacturing sector both years. Retention rates ranged from 94.1 percent for petroleum and refining to 86.9 percent for electrical and communications equipment.

### Overview

Educational institutions, particularly four-year colleges and universities continue to employ the majority (57 percent in 1977) of doctoral scientists and engineers.<sup>1</sup> However, as higher education enrollments decline and the gap widens between available faculty positions and the number of science and engineering (S/E) Ph.D.'s, many who may have preferred a career in academe are now taking jobs in other employment sectors.<sup>2</sup> Because of the tightening academic job market, considerable attention has been focused on the ability of other types of employers to absorb doctoral scientists and engineers.

Business and industry (includes manufacturing, nonmanufacturing, self-employed), the second largest employer of highly trained scientists and engineers,<sup>3</sup> has shown the

<sup>1</sup>The science/engineering Ph.D. fields include mathematics, computer sciences, physics/astronomy, chemistry, earth, environmental, and marine sciences, engineering, life sciences (agricultural, medical, and biological), psychology, and social sciences. A detailed list of fields appears as part of the 1977 survey questionnaire reproduced in Appendix A.

<sup>2</sup>Fernandez, Luis, <u>U.S. Faculty After the Boom: Demographic</u> <u>Projections to 2000</u>, Berkeley, Carnegie Council on Policy Studies in Higher Education, 1978. Radner, Roy and Kuh, Charlotte, <u>Preserving a Lost Generation: Policies to Assure</u> <u>a Steady Flow of Young Scholars Until the Year 2000.</u> Berkeley, Carnegie Council on Policy Studies in Higher Education, 1978.

<sup>3</sup>National Research Council, Commission on Human Resources, <u>Science, Engineering, and Humanities Doctorates in the</u> <u>United States, 1977 Profile</u> (Washington, D.C.: National Academy of Sciences, 1978), p. 16. greatest gain in the number of Ph.D.'s employed over the past few years. While the total labor force of S/E Ph.D.'s increased by approximately 28 percent between 1973 and 1977 (from 218,000 to 280,200), the number working in business and industry increased nearly 34 percent (from 52,900 to 70,600).

This report looks at the characteristics of science and engineering Ph.D.'s employed in business and industry. Data are presented from the 1973 and 1977 Surveys of Doctorate Recipients on demographic characteristics, academic background, the type of job held within business and industry, and the primary work activity performed. Contrasts between characteristics of the total employed population of S/E Ph.D.'s and the business and industry group have also been noted. Although the time interval is limited, some interesting tendencies between 1973 and 1977 seem apparent, and readers may want to used the earlier data to make further comparisons of their own. Analyses for the periods 1973-1975 and 1975-1977 have been excluded because the changes are small and often statistically insignificant.

The body of the report consists of three chapters. Chapter 1 defines the population of Ph.D. scientists and engineers in the United States and subgroups such as the labor force and those employed in business and industry. The 1973 and 1977 demographic data include such variables as sex, racial/ethnic background, age, doctoral field, and year in which the Ph.D. was awarded (cohort). Distribution of the total employed S/E doctoral population and the business and industry group are compared, and observed changes over time are analyzed.

Employment characteristics include primary work activity, field of employment, and business and industry group. The relationships among these variables are discussed in Chapter 1, along with an examination of the type of employer of newly graduated Ph.D.'s by the Ph.D. field of the employee.

Federal support status and agency of support are also analyzed in Chapter 1. A recent report<sup>4</sup> from the

<sup>&</sup>lt;sup>4</sup>Division of Science Resource Studies, <u>Federal Funds for</u> <u>Research, Development and Other Scientific Activities</u>, (Washington, D.C.: National Science Foundation, 1978), pp. 13-15.

National Science Foundation noted that federal expenditures for research and development (R&D) activities in business and industry increased in fiscal year 1976, largely as a result of support by the Department of Defense, the Department of Energy, and the National Aeronautics and Space This emphasis on R&D reversed the trend Administration. that existed between 1968 and 1974, when total federal R&D funding declined 3.7 percent in constant dollars.<sup>5</sup> The industry sector was affected not only by the decrease in federal R&D funds, but by a cut in its share of this reduced money, from 59 percent in 1968 to 48 percent in 1975.<sup>6</sup> Between 1975 and 1976, however, total expenditures by business and industry for R&D (company plus federal funds) increased by 5 percent.<sup>7</sup> Because the increase occurred during the year preceding the 1977 survey, the effect on jobs in business and industry cannot be fully assessed. But it is reasonable to infer that R&D money tends to create research jobs for scientists and engineers, and that some increase can be expected in the number of S/E Ph.D.'s in business and industry when the flow of R&D funding accelerates.

In Chapter 2, salary distributions for the S/E Ph.D.'s in business and industry by primary work activity, business and industry group, and field of employment are examined. Salary increases between 1973 and 1977 are compared with cost-of-living increases in the same period.

Chapter 3, the final section of the report, looks at mobility both in the S/E Ph.D. labor force and in the business and industry subpopulation. The movement from doctoral field to employment field is traced for the business and industry group. For the S/E Ph.D. labor force, data are presented on shifts among the major employment sectors between the two survey years. Finally, shifts among the various business and industry groups are analyzed for those employed in the business sector in both 1973 and 1977.

<sup>5</sup>Division of Science Resources Studies, <u>Federal Funds</u>, p. 2.

<sup>6</sup>Division of Science Resources Studies, Federal Funds, p. 8.

<sup>7</sup>Division of Science Resources Studies, "Industrial R&D Spending Reached \$26.6 Billion in 1976," <u>Highlights,</u> (Washington, D.C.: National Science Foundation, NSF78-306, May 1978), p. 1.

#### Survey Sample

The data for this study were collected from the 1973 and 1977 Surveys of Doctorate Recipients (See Appendix A for the questionnaires). The surveys were conducted by the Commission on Human Resources of the National Research Council (CHR/NRC) under the sponsorship of the National Science Foundation, the National Endowment for the Humanities, and the National Institutes of Health.

The 1973 sample included science and engineering doctorates who earned degrees during the period 1930-1972, while the 1977 sample consisted of the 1934-1976 cohorts, or 42 years for each survey. The samples were stratified by field of doctorate or, for a small number of respondents whose degrees were not in science or engineering, the field of science/engineering employment; the year in which the doctoral degree was awarded; sex; location of Ph.D. institution (U.S. or foreign); size of Ph.D. institution (for the 1973 sample only); and racial/ethnic group (for the 1977 sample only). Appendix B gives the sample sizes and response rates for the two surveys by each stratifying variable. A detailed description of the weighting procedure is provided in Appendix C.

Throughout the report, whenever observed differences between categories or between the two survey years are not significant at the .95 level of confidence (i.e., whenever the estimated difference divided by its sampling errors is less than 2), the reader is so advised. The procedure followed in estimating sampling errors is described in Appendix D.

# Demographic and Employment Characteristics

1

The population of doctoral scientists and engineers (S/E) in the United States was approximately 295,800 in 1977.<sup>8</sup> The size of the 1977 S/E labor force<sup>9</sup> was estimated at 280,200 Ph.D.'s, of whom 276,900 were employed and 3,300 unemployed and seeking employment.<sup>10</sup> Figure 1 shows the relationship that exists among the population, labor force, and employed segment of the S/E population. The distribution of the employed doctoral S/E population by type of employer in 1977 is also given in Figure 1.

Between 1973 and 1977, the number of Ph.D. scientists and engineers in the labor force increased by approximately 28 percent, from 218,000 to 280,200. The number of S/E doctorates employed in business and industry, however, increased nearly 34 percent, from 52,900 to 70,600 (Figure 2).

<sup>8</sup>National Research Council, Commission on Human Resources, <u>Science, Engineering, and Humanities Doctorates in the</u> <u>United States, 1977 Profile</u> (Washington, D.C.: National Academy of Sciences, 1978), p. ix.

<sup>9</sup>Labor force estimates consist of those Ph.D.'s who indicated in the 1977 Survey of Doctorate Recipients that they were: (1) full-time employed; (2) part-time employed; (3) on a postdoctoral appointment; or (4) unemployed and seeking employment.

<sup>10</sup>National Research Council, Commission on Human Resources, <u>1977 Profile</u>, p. ix.

#### TABLE 1B Demographic Characteristics of Doctoral Scientists and Engineers, 1977

\*Less than 50.

Within each group (i.e., the total employed S/E Ph.D. population and the business and industry subpopulation) most changes in demographic characteristics between 1973 and 1977 were not significant. However, the proportion of women in the total employed population rose from 7.5 percent in 1973 to 9.5 percent in 1977. Although the actual number of women in business and industry remained small, it doubled during this period, and the percentage increased from 2.5 to 4.0 percent. Otherwise, the distribution of Ph.D.'s by such variables as age, cohort, and field of doctorate remained fairly stable for both the total population and the business and industry sector.

The more interesting comparisons lie between the characteristics of the total employed population of S/E Ph.D.'s and those working in business and industry. Few differences exist between the two groups for certain variables such as age and year of Ph.D. It is interesting to note, however, that 59.4 percent of the Ph.D.'s working in business and industry in 1977 had degrees in either chemistry or engineering, compared with 30.4 percent in the total S/E employed population. Conversely, larger percentages of Ph.D.'s in the biological sciences, psychology, and the social sciences, and to a lesser extent mathematics, were working in employment sectors other than business and industry.

In comparison with the total employed S/E population, a slightly higher proportion of those employed in business and industry were foreign citizens (8.0 percent versus 6.0 percent).<sup>11</sup> This may be partly attributed to the fact that chemistry and engineering--fields in which the majority of those employed in business and industry had earned their Ph.D.'s--contain relatively high percentages of foreign citizens.<sup>12</sup> Similarly, there is a higher proportion of racial minorities (including Blacks, Asians, and American Indians) in the business and industry sector (9.0 percent) than in the total employed population (6.6 percent). Like foreign citizens, racial minorities constitute relatively high percentages of Ph.D. recipients in chemistry and

<sup>&</sup>lt;sup>11</sup>See Appendix D for a discussion of the effects of nonresponse bias on estimates of demographic data.

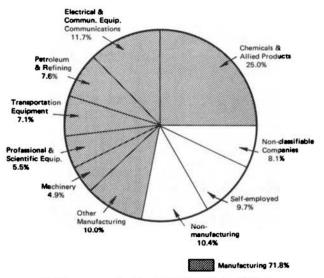

<sup>&</sup>lt;sup>12</sup>National Research Council, Commission on Human Resources, 1977 Profile, p. 12.

engineering.13

In both survey years higher proportions of women Ph.D.'s were found in the total employed population than in business and industry--7.5 percent compared to 2.5 percent in 1973 and 9.5 percent compared to 4.0 percent in 1977. This is partly a function of the small proportions of women among doctoral graduates in engineering (0.6 percent in 1977) and chemistry (6.6 percent).<sup>14</sup> It also reflects the fact that there are large percentages of women among Ph.D.'s in the biological sciences, psychology, and the social sciences; fields that have higher percentages of Ph.D.'s working outside business and industry.

#### Business and Industry Group by Field of Employment

The distribution of all S/E doctorates who were working in business and industry in 1977 by the broad business and industry groups in which they were employed is shown in Figure 3. Over 70 percent of all the Ph.D.'s were employed

NOTE: Percentages are based on an estimated population of 70,600.

in manufacturing, with 25 percent in chemical and allied products alone.

Table 2A shows the distribution of the 52,900 doctoral scientists and engineers employed in business and industry in 1973 by field of employment and business/ industry group. Table 2B give analogous data for the 70,600 Ph.D.'s who were employed in business and industry in 1977.

In both survey years, the highest percentages of Ph.D.'s in most employment fields were working in manufacturing businesses. In both 1973 and 1977 the manufacturing businesses included, for example, over 90 percent of those employed as chemists and over 80 percent of those employed as physicists. A majority of the Ph.D.'s in the biological sciences, engineering, mathematics, computer sciences, earth sciences, and medical sciences were also working in manufacturing businesses. On the other hand, a greater number of Ph.D.'s employed in the social sciences were working in non-manufacturing, including real estate, banking, finance, and consulting institutions, than in any other business and industry group (33.3 percent in 1973 and 40.5 percent in 1977). An interesting finding is that in 1977 two out of every three Ph.D.'s working in psychology were self-employed.

Although the number of S/E doctorates in manufacturing businesses increased from 40,100 in 1973 to 50,700 in 1977, the corresponding proportion of doctorates in manufacturing businesses declined between the two survey years (75.8 percent and 71.8 percent, respectively). The employment field of computer sciences showed the greatest shift of S/E Ph.D.'s moving from manufacturing to non-manufacturing (82.2 percent were in manufacturing businesses in 1973 compared with 70.8 percent in 1977); however, the numbers increased from 800 in 1973 to 2,100 in 1977. Agricultural sciences also had a high percentage of Ph.D.'s who changed from manufacturing businesses in 1973 to non-manufacturing businesses in 1977 (from 66.2 percent in manufacturing businesses in 1973 to 54.8 percent in 1977).

Estimates of the number of S/E Ph.D.'s by detailed business and industry group in 1977 are reported in Appendix F, Table F.2. Industrial organizations have been classified according to the Enterprise Standard Industrial Classification, which was developed by the Office of Management and Budget, Executive Office of the President, as revised by the Securities and Exchange Commission (SEC). A listing of these SEC codes is included following Table F.2. Table F.3 in Appendix F contains estimates of the number of S/E Ph.D.'s employed in business and industry in 1977 by fine field of employment.

#### Primary Work Activity and Business/Industry Group

Tables 3A and 3B present breakdowns of the business and industry categories in which S/E Ph.D.'s were employed and the principal functions that they performed.

In both 1973 and 1977, research and development (R&D) was the predominant work activity of Ph.D. scientists and engineers employed in business and industry--more than 40.0 percent, excluding R&D management and administration. Between 1973 and 1977, the number engaged in R&D increased from 22,900 to 29,900. In both survey years over 50 percent of the Ph.D.'s who were working in the electrical and communications equipment, transportation equipment, and machinery industries were employed primarily in R&D.

In 1973 and 1977, approximately one-third of the S/E Ph.D.'s in business and industry worked in management and administration, the second most predominant work activity. The percentages of Ph.D.'s in the various manufacturing categories who worked as managers in 1977 ranged from 32.2 percent in machinery to 46.5 percent in the "other manufacturing" category. In contrast, only about 8.5 percent of the self-employed were engaged in management in 1977.

The overall percentage of Ph.D.'s in management and administration dropped from 37.2 percent in 1973 to 33.7 percent in 1977 (although the actual numbers increased from 19,700 to 23,800). This may be explained partly by the influx of new Ph.D.'s (i.e., 1973-1976 cohorts), who constituted 21 percent of the population employed in business and industry. An analysis of the 1977 data shows that 38.5 percent of those who received doctorates between 1934 and 1972 were working in management and administration, compared with 16.3 percent of the recent doctorate recipients. The majority of the 1973-1976 Ph.D.'s--56.8 percent compared with 38.5 percent of the 1934-1972 cohorts-were working in research and development.

For the most part, the distribution of Ph.D.'s by primary work activity and business and industry group

showed little change from 1973 to 1977. In the petroleum industry, the percentage employed in management decreased from 38.4 percent in 1973 to 33.8 percent in 1977. Nonclassifiable companies had a smaller percentage of managers in 1977 and a larger percentage of Ph.D.'s engaged in "other" primary work activities, including production, sales, quality control, and writing/editing.

As expected, a majority of self-employed scientists and engineers were engaged in consulting or other professional services, 59.1 percent in 1973 and 67.0 percent in 1977. While the percentage of S/E Ph.D.'s engaged in consulting activities was essentially unchanged between 1975 and 1977, the proportion providing professional services increased from 36.4 percent to 45.3 percent.

#### Primary Work Activity and Sex

Tables 4A and 4B show the distribution of men and women engaged in various work activities in business and industry in 1973 and 1977.

The distribution by sex shows that research and development, the predominant work activity for the total S/E employed population (Tables 3A and 3B), was also the main activity for women as well as men. In both survey years, however, a smaller percentage of women worked in R&D (35.3 percent for women vs. 43.4 percent for men in 1973 and 31.2 percent vs. 42.9 percent in 1977). While a slightly higher proportion of women than men held jobs in basic research in both 1973 and 1977, women were less extensively engaged in development activities (3.5 percent for women vs. 11.9 percent for men in 1973 and 3.6 percent for women compared with 12.9 percent for men in 1977).

The distribution also shows that management and administration was the second most frequent work activity for men, but not for women. In both survey years, substantially smaller percentages of women held management and administrative positions, 13.5 percent compared with 37.8 percent for men in 1973 and 11.8 percent compared with 34.6 percent for men in 1977. Although a greater number of both men and women were employed as managers in 1977, the proportion of men working in management decreased from 37.8 percent in 1973 to 34.6 percent in 1977. The relative decline for women during this period is not statistically significant. Differences also exist in the proportions of men and women providing professional services. In 1973, 23.4 percent of the women Ph.D.'s provided professional services, compared with only 3.3 percent of the men. Although the proportion of men in this activity remained essentially unchanged between 1973 and 1977, for women it rose to 30.5 percent (approximating the percentage of women in R&D). Analysis shows that in 1977, 80.0 percent of the women engaged in professional services were self-employed psychologists. The analysis also shows that a far higher percentage

of the women Ph.D.'s were self-employed, 37.6 percent vs. 7.3 percent of the men in 1973 and 38.9 percent vs. 8.5 percent of the men in 1977.

#### Primary Work Activity by Field of Employment

Tables 5A and 5B give the percentages of S/E Ph.D.'s performing the various primary work functions within each field of employment.

A majority of the Ph.D.'s working in mathematics, computer sciences, physics, and chemistry were employed primarily in research and development activities in 1973 and 1977. Although basic research was the principal activity of only about 6 percent of the total S/E Ph.D.'s in both survey years, relatively high percentages of the Ph.D.'s working in physics (20.0 percent), biology (15.1 percent), and chemistry (12.7 percent) were engaged in this activity. In both survey years, higher proportions of the Ph.D.'s in all fields were working in applied research--the principal activity of nearly one-fourth of the total S/E Ph.D. population--than in basic research. The employment fields of mathematics and physics had the highest percentages of Ph.D.'s in applied research (45.9 percent and 42.8 percent, respectively, in 1977). Although development was the primary activity of only 11.7 percent of the total group in 1973 and 12.5 percent in 1977, in both years it was the principal work function of a high percentage of Ph.D.'s working in the computer sciences. In 1973, 39.5 percent of Ph.D.'s employed in computer sciences were engaged in developing equipment, products, systems, or data (mainly for software systems). In 1977, 44.1 percent of those working in computer sciences were employed in development. In both survey years, one out of every five Ph.D.'s in the engineering field of employment was working in development.

In 1973, high proportions of Ph.D.'s working in the life sciences were employed in management and administration; 49.8 percent for medical sciences, 47.9 percent for agricultural sciences, and 45.2 percent for biological sciences. Somewhat smaller percentages of the Ph.D.'s in these three fields were working in management and administration in 1977. A decline in the percentage of Ph.D.'s working in management activities in the medical sciences was accompanied by an increase in the proportion of those providing professional services, from 12.8 percent in 1973 and 18.9

percent in 1977. In both survey years, high proportions of Ph.D.'s employed in the nonscience fields, which include business administration, worked in management (41.2 percent in 1973 and 45.5 percent in 1977).

In the social sciences, a shift from management and administration to R&D occurred between 1973 and 1977. In 1973, 32.2 percent of the Ph.D.'s employed in the social sciences were engaged in management, compared with 28.6 percent in R&D. By 1977, the proportion in management had declined to 19.1 percent, while the proportion in R&D had increased to 43.7 percent. A similar movement from management to R&D took place in mathematics, where the proportion of Ph.D.'s in management and administration decreased from 23.4 percent to 12.4 percent between 1973 and 1977 and the proportion in R&D increased from 56.3 percent to 66.4 percent.

In 1973, 50 percent of the Ph.D.'s employed in psychology provided professional services. By 1977, 57.5 percent of the Ph.D.'s in the employment field of psychology were engaged in this activity. Analysis shows that in 1977, 66.4 percent of all Ph.D.'s providing professional services were working in the field of psychology.

#### Area of National Interest and Federal Support Status

Of the 70,600 science and engineering Ph.D.'s working in business and industry in 1977, an estimated 15,600 had some portion of their work supported by federal funds. Of these, nearly 60 percent reported a significant amount of their professional time was devoted to national defense or energy/fuel matters. Much smaller percentages of the federally supported S/E Ph.D.'s in business and industry were working in each of the other national interest areas (Table 6).

In contrast, scientists and engineers who received no funding from U.S. government sources were most frequently involved in energy/fuel or health topics (18.0 percent and 15.6 percent respectively). Over one-third of the total S/E population in business and industry devoted significant amounts of professional time to either health or energy/fuel.

Comparable 1973 data are not available because the

# 1973 survey questionnaire did not include an item on area of national interest.

#### Business and Industry Group by Agency of Federal Support

Table 7 gives the distribution of the 15,600 scientists and engineers who were receiving U.S. government support in 1977 by business and industry group and the agency providing the support.

Nearly one-half of all federal funded S/E Ph.D.'s received at least part of their support from the Department of Defense (DOD). Of these individuals, one-third were employed in the manufacturing of transportation equipment (primarily aircraft, missiles, and ships), while 22.5 percent worked in the electrical and communications equipment industry.

The Energy Research and Development Administration (ERDA)<sup>15</sup> was the second largest supporter of industry-em ployed Ph.D.'s. ERDA-funded scientists and engineers were employed primarily in businesses that manufactured electronic

<sup>&</sup>lt;sup>15</sup>ERDA was reorganized and absorbed by the Department of Energy, which was created after the 1977 Survey of Doctorate Recipients was conducted.

and communications equipment, chemicals and allied products, and transportation equipment. The largest proportion of the Ph.D.'s whose work was supported by the National Aeronautics and Space Administration (NASA) were employed in the manufacturing of transportation equipment, 41.6 percent.

Relatively high percentages (ranging from 24 to 36 percent) of the Ph.D.'s whose work was funded by the Department of Transportation (DOT), the Environmental Protection Agency (EPA), the National Science Foundation (NSF), and the Nuclear Regulatory Commission (NRC) were employed in non-manufacturing businesses.

Almost one-third of the Ph.D.'s whose employment was supported by the Department of Health, Education and Welfare (DHEW) were self-employed. An analysis of this group indicated that nearly two-thirds were psychologists engaged in consulting or professional services.

#### Type of Employer and Field of Doctorate for Recent Ph.D.'s

Table 8A gives the 1973 Survey data for all individuals who received their Ph.D.'s in science and engineering in fiscal year 1972 (July 1, 1971 - June 30, 1972). Table 8B gives analogous statistics from the 1977 Survey for fiscal year 1976 (July 1, 1975 - June 30, 1976).

By field of Ph.D., recent Ph.D.'s in computer sciences showed the greatest increase in industrial employment between 1973 and 1977 (from 23.7 percent to 57.0 percent), with a corresponding decline in the percentage employed in educational institutions (from 51.5 percent to 33.3 percent). During the period an increasing proportion of new psychologists accepted employment in business and industry, 5.3 percent in 1973 and 9.8 percent in 1977. There was a slight increase in the percentage of new S/E Ph.D.'s taking jobs in business and industry between 1973 and 1977 (17.3 percent compared with 18.5 percent), but this was not statistically significant.

Similar proportions of recent Ph.D.'s took jobs in educational institutions in 1977 (61.7 percent) as in 1973 (62.4 percent). However, shifts into and out of academic employment occurred in a number of fields. Like computer scientists, a smaller portion of the social scientists accepted jobs in educational institutions in 1977 (75.8 percent) compared with 1973 (82.6 percent). In only a few fields was there a relative increase in academic employment for new Ph.D.'s, and among these only physics Ph.D.'s showed a statistically significant gain (from 49.9 percent to 60.3 percent). This increase appears to be related to a decrease in the proportion of Ph.D. physicists entering government service (from 25.2 percent to 10.1 percent).

For all fields combined, the percentage of recent doctorate recipients who accepted government employment (federal, state, or local) declined from 12.2 percent in 1973 to 9.3 percent in 1977. Among the individual fields, the largest decrease between 1973 and 1977 (15.1 percentage points) occurred for government employed physicists. A relative decline also occurred in the employment of chemists in government from 11.5 percent to 6.0 percent. In a number of other fields, estimated differences in the percentages of government employment are not statistically significant. tp://www.nap.edu/catalog.php?record\_id=19838

# 2 Ph.D. Salaries in Business and Industry

In this chapter, median annual salaries of science and engineering Ph.D.'s employed full-time in business and industry are examined in relationship to their primary work activity, business and industry group, and field of employment. Changes in salaries between 1973 and 1977 are compared with cost-of-living increases that occurred during the same period.

## Salary Estimates by Primary Work Activity and Business/Industry Group

Tables 9A and 9B show the estimated median annual salaries for the total full-time S/E Ph.D.'s employed in business and industry by the type of work they performed.

The median annual salary estimates for the business/ industry employed S/E Ph.D.'s were \$23,200 in 1973 and \$29.900 in 1977. Among the business and industry groups, self-employed doctoral scientists and engineers had the highest median salaries in both 1973 (\$30,200) and 1977 (\$32,400). This finding appears to be related to the large proportion of self-employed individuals providing professional services, an activity for which median salaries were as high as \$30,600 in 1973 and \$36,500 in 1977. Along with the self-employed group, Ph.D.'s working in the petroleum and refining industry had an estimated median salary of approximately \$32,000 in 1977. Ph.D. employees of nonclassifiable companies had the lowest median salary for that year, \$25,900. Estimated 1973 median salaries varied little among the other business and industry groups, ranging from \$22,000 in other manufacturing to \$24,000 in the electrical and communications equipment and the

machinery industries.

Among the various primary work activities, the highest median salaries in 1977 were estimated for those who were engaged in management and administration (\$34,600) and professional services (\$35,200). In 1973, managerial and administrative Ph.D.'s in the petroleum and refining, machinery, and electrical and communications equipment industries had a median salary of approximately \$29,000. In 1977, management salaries in petroleum and refining (\$38,700), electrical and communications equipment (\$36,300), and professional and scientific equipment (\$36,200) were among the highest estimated medians.

In research and development, the primary work activity in which the highest percentage of Ph.D.'s were engaged in both years (over 40 percent), median salaries were about 20 percent below salaries earned by those Ph.D.'s in management and administration (\$21,300 vs. \$27,000 in 1973 and \$27,200 vs. \$34,600 in 1977). (See Tables 3A and 3B for the distribution of S/E Ph.D.'s by primary work activity and business/ industry group.) Median salaries for those engaged in R&D in the manufacturing sector ranged from \$19,500 (other manufacturing) to \$22,500 (machinery) in 1973 and from \$24,900 (other manufacturing) to 28,900 (petroleum and refining) in 1977. In both survey years, the median salaries of Ph.D.'s working in basic research, applied research, and development were comparable both for the total population and most business and industry groups.

Longitudinal comparison of salary data shows that the median annual salary of all doctoral scientists and engineers employed full-time in business and industry increased nearly 29 percent between 1973 and 1977 (from \$23,200 to \$29,900). However, the Bureau of Labor Statistics reported an increase in the Consumer Price Index of approximately 38 percent, from 128.6 in February 1973 to 177.1 in February 1977,<sup>16</sup> the two months for which the data were requested in the 1973 and 1977 Survey questionnaires. Thus, the 1977 median salary for S/E Ph.D.'s employed full-time in business and industry was less than the 1973 median when adjusted for inflation.

<sup>&</sup>lt;sup>16</sup>U.S. Department of Labor, Bureau of Labor Statistics, <u>Monthly Labor Review</u>, April 1973, Vol. 96, No. 4, p. 112 and April 1977, Vol. 100, No. 4, p. 109. The index numbers are computed on a base of 100.0 for 1967.

Changes in median annual salaries over the period varied among the business and industry groups. In 1977, the median salary for all manufacturing groups was 30 percent higher than in 1973 (\$30,100 vs. \$23,100), while salaries in nonmanufacturing and non-classifiable companies had risen less than 20 percent (from \$22,800 to \$27,300 and from \$22,700 to \$25,900). During this period self-employed scientists and engineers showed an increase of only 7.3 percent, although in both years the self-employed groups had the highest median salaries.

Salary increases varied less by primary work activity over the 4-year period than by business and industry group. The medians for the major activities of R&D and management and administration both increased about 28 percent between 1973 and 1977. Within management and administration, managers of R&D had the highest salary increase between 1973 and 1977, from \$26,300 to \$34,300 (30 percent). Among the other major work activities, Ph.D.'s engaged in consulting and professional services had the smallest increase (20.0 percent and 17.3 percent, respectively). This is consistent with the small increase noted earlier for self-employed scientists and engineers, two-thirds of whom were engaged either in consulting or in providing professional services in 1977.

### Salary by Primary Work Activity and Field of Employment

Tables 10A and 10B give the 1973 and 1977 median salaries of full-time employed S/E Ph.D.'s in business and industry according to their work functions and employment fields.

For both survey years, the salaries of S/E Ph.D.'s showed considerable variation by field of employment. In 1973, the highest estimated medians were \$30,000 for Ph.D.'s working in psychology, \$27,300 for those in the social sciences, \$26,200 for scientists in medical sciences, and \$25,900 for S/E Ph.D.'s working in nonscience fields. The Ph.D. scientists in agricultural fields had the lowest median salary in 1973, \$21,800 per year.

In 1977, the highest median salaries were again for Ph.D.'s working in psychology (\$33,600), followed by those in medical sciences (\$33,200) and the nonscience fields (\$31,800). There were slight differences in the

No Report	26.2													

NOTE: Median salaries were computed only for Ph.D.'s employed full-time. Median salaries have not been calculated for cells with fewer than 20 individuals reporting salary.

median salaries in the other employment fields, ranging from a low of \$26,700 in computer sciences to \$30,100 in the social sciences, a range of less than \$3,500.

Examination of salaries by primary work activity indicate that median salaries for Ph.D.'s employed in research and development in 1973 ranged from \$25,300 for psychologists to \$18,900 for agricultural scientists. In 1977, the R&D salaries ranged from a median of \$30,000 for psychologists to \$25,100 for agricultural and biological scientists (excluding the "no report" category).

In management and administration, the highest median salaries in 1973 were for Ph.D.'s in the social sciences (\$35,000) and psychology (\$33,100). Relatively low median salaries for managers and administrators (approximately \$25,000) were estimated for Ph.D.'s in agricultural sciences, earth sciences, and chemistry. However, managers of R&D and other activities in the field of chemistry in 1973 had a relatively high median salary of \$32,600. By 1977, the highest median salaries for managers and administrators were in the nonscience fields (\$40,400), the medical sciences (\$36,600), the social sciences (\$35,900), and engineering (\$35,000). The estimated management salaries for all other fields in 1977 ranged from \$34,400 for those working in physics to \$29,500 for those in the agricultural sciences.

The data in Tables 5A and 5B indicate that well over one-half of the Ph.D.'s employed in psychology were engaged in either consulting or professional services activities. The median salaries for these activities were \$25,700 for consulting and \$30,300 for professional services in 1973. Corresponding estimates for 1977 were \$30,400 for consulting and \$35,600 for professional services. Ph.D. engineers-who constituted one-third of all consultants in both surveys-had an estimated median salary of \$22,700 in 1973 and \$30,100 in 1977. Between 1973 and 1977 the median salary of Ph.D.'s who were providing professional services and working in the medical sciences rose from \$35,000 to \$54,400.

As noted, the Consumer Price Index rose approximately 38 percent between February 1973 and February 1977, the reference time period of the two surveys. None of the increases in median salaries in the various fields of employment kept pace with the rise in the cost of living, as is evident from Table 10C. The median salary for Ph.D.'s working in chemistry increased more than 32 percent between 1973 and 1977. Medians for the social scientists and psychologists increased only 10.2 percent and 12.0 percent, respectively. For most fields, the increase was substantially below the rate of inflation.

		Median Salary nds of Dollars)

# Mobility of Ph.D.'S in Business and Industry

The longitudinal nature of the data from the Survey of Doctorate Recipients lends itself to an assessment of the career patterns of Ph.D.'s in the United States. Chapter 3 addresses the issues of mobility for science and engineering doctorates in business and industry, including field mobility (the transition from field of doctorate to field of employment), employer mobility (movement among employment sectors), and industry group mobility (movement among the various segments of the business and industry sector).

## Field Mobility

3

Data on mobility from doctoral field to employment field for the scientists and engineers employed in business and industry in 1977 are presented in Table 11.

In 1977, the S/E Ph.D.'s showing the highest proportion of employment in their doctoral fields were computer scientists (92.3 percent) and psychologists (88.4 percent). Large proportions of engineers (81.9 percent), and medical scientists (80.0 percent) were also working in their fields. Ph.D. recipients who were least likely to be employed in fields corresponding to their doctoral disciplines were mathematicians (with only 36.6 percent remaining in the field), physicists and astronomers (40.7 percent), biological scientists (41.4 percent), and social scientists (48.9 percent).

Approximately 30 percent of all S/E Ph.D.'s in business and industry in 1977 were working in engineering, the largest field of employment. In addition to the high percentage of engineering Ph.D.'s working in their field, 31.2 percent of the physicists, 17.6 percent of the mathe-

 TABLE 11
 Field of Mobility of Doctoral Scientists and Engineers Employed in Business and Industry, 1977

36

 $-\infty$ 

maticians, 8.7 percent of chemists, and 7.6 percent of the earth scientists were in the field of engineering. Computer sciences also drew heavily from other disciplines: 24.4 percent of the mathematicians worked in the computer field, as did 8.4 percent of the physicists and 5.3 percent of the engineers.

Among the more mobile groups, mathematics and physics Ph.D.'s gravitated largely to engineering and computer sciences, although 11.0 percent of mathematicians entered nonscience fields. Of the Ph.D.'s in other disciplines showing a high degree of field mobility, the biological scientists switched mainly to the closely related medical sciences (19.5 percent) and agricultural sciences (10.6 percent); an additional 10.8 percent, mostly biochemists moved to chemistry. The highest proportion of social scientists working outside their doctoral field (28.2 percent) were employed in nonscience jobs.

A number of forces appear to affect field mobility. Some educational fields for instance, have traditionally permitted a substantial degree of employment mobility; and the definition of the employment fields may in itself play a role. Personal goals and preferences may also have an effect, especially when the job market is tight.<sup>17</sup>An investigation of these and other factors, however, is beyond the scope of this report.

### Employer Mobility

Tables 12A and 12B present data on mobility among various employment sectors during the 1973-1977 period. This analysis is based on data for S/E Ph.D.'s who were in the U.S. labor force in both years and who responded to both the 1973 and 1977 surveys.

Data regarding type of employer of the total Ph.D. labor force in the two survey years are presented in Table 12A.

Between 1973 and 1977, the proportion of science and engineering Ph.D.'s employed in business and industry

<sup>&</sup>lt;sup>17</sup>National Research Council, Commission on Human Resources, <u>Field Mobility of Doctoral Scientists and Engineers</u>, (Washington, D.C.: National Academy of Sciences, 1975).

Type of Employer	1973	1977
	%	%
Business and Industry	23.7	25.6
Educational Institution	58.3	57.4 -
Government	11.3	9.9
Other	5.8	5.8
Unemployed, seeking employment	0.8	0.8
No Report	0.1	0.5

 
 TABLE 12A
 Distribution of the Doctoral Science and Engineering Labor Force by Type of Employer, 1973 and 1977\*

\*Percents are based on the number (170,800) of doctoral scientists and engineers who were in the labor force in both 1973 and 1977. The procedure followed to obtain the estimates is described in Appendix E.

increased from 23.7 to 25.6 percent. During the same period, the segment of S/E Ph.D.'s employed in educational institutions declined from 58.3 percent to 57.4 percent and the segment working in government decreased from 11.3 percent to 9.9 percent.

Table 12B shows the 1977 retention/redistribution pattern of the S/E Ph.D.'s who worked in each of the various employment sectors in 1973 or who were unemployed and seeking employment.

Business/industry and educational institutions retained the highest percentages of S/E Ph.D.'s between 1973 and 1977, with over 90 percent remaining in each sector. In contrast, only 72.7 percent of the Ph.D.'s working in government in 1973 were still government employees in 1977. Among those who left the government sector, 12.3 percent gained employment with educational institutions and 8.5 percent moved into "other" employment (principally, hospitals, clinics, and nonprofit organizations). Over 20 percent of those in "other" employment in 1973 had moved to educational institutions in 1977.

Although 16.4 percent of those Ph.D.'s who were unemployed in 1973 were also seeking work in 1977, this group represents only 0.1 percent of the total labor force. Of the Ph.D.'s unemployed and seeking employment in 1973, over two-thirds were working in either business and industry or education in 1977. Conversely, only 0.7 percent of the

Machinery	4.3	5.1
Other Manufacturing	11.3	11.2
Nonmanufacturing	7.6	8.0
Self-employed	5.7	6.0
Non-classifiable companies	5.7	4.7

•Percents are based on the number (37,400) of doctoral scientists and engineers who were employed in business and industry in both 1973 and 1977. The procedure followed to obtain the estimates is described in Appendix E.

The overall percentages of science and engineering Ph.D.'s in the various groups fluctuated only slightly from 1973 to 1977. This stability may be explained in part by the high retention rates in the manufacturing industries, where over 80 percent of the doctoral scientists and engineers were employed in both years. Table 13B shows the retention and redistribution in 1977 of the Ph.D.'s who were working in each of the industry groups in 1973. Within the different manufacturing areas, retention rates ranged from 94.1 percent to 86.9 percent for the petroleum/ refining and the electrical and communications equipment industries, respectively,

Science and engineering doctorates employed in nonclassifiable companies appeared to be the most mobile group;

# TABLE 13B Industry Group Mobility of Doctoral Scientists and Engineers, 1973-1977

4

only about one-third of the Ph.D.'s working for such firms in 1973 were still employed by them in 1977. Over 35 percent moved to the manufacturing sector, nearly one-half of them into chemicals and allied products, and nearly 20 percent moved into non-manufacturing companies. It is, however, difficult to estimate the extent to which this represents a real shift. In part, this "movement" may be explained by the SIC coding of certain firms in 1977 that could not be classified in 1973.

In the nonmanufacturing group, nearly 30 percent of the Ph.D.'s moved to new employment sectors by 1977; 17.2 percent of them to manufacturing and 8.0 percent to nonclassifiable companies. One quarter of the Ph.D.'s who were self-employed in 1973 were employees of a company in 1977, 12.4 percent of them working for non-classifiable companies and 6.9 percent in manufacturing industries.

## NATIONAL RESEARCH COUNCIL

#### NATIONAL ACADEMY OF SCIENCES NATIONAL ACADEMY OF ENGINEERING

2101 CONSTITUTION AVENUE WASHINGTON, D.C. 20418

OFFICE OF SCIENTIFIC PERSONNEL

March 1973

Dear Colleague:

The National Science Foundation has asked the National Academy of Sciences-National Academy of Engineering-National Research Council to assist it in operating the Manpower Characteristics System. The Foundation has established the System to provide data needed to assay this Nation's human resources in the sciences and engineering and guide in the development of national policies and programs.

As our part of the task, we shall maintain information about recipients of the earned doctorate in the natural and social sciences, mathematics, and engineering. Already available data will be utilized to the greatest extent possible. We believe the Survey of Doctoral Scientists and Engineers will provide critically needed data bearing on the problem of utilization and supply of doctoral scientists and engineers, the support of graduate education, and the support of research and development and postdoctoral activities.

We seek your help. You are one of a carefully drawn sample of doctoral scientists and engineers who are being asked to provide current data. The questionnaire on the following pages has been designed to make minimum demands upon your time and yet to provide data that in the aggregate will be statistically significant and useful. Some data already available to us have been preprinted on the form to conserve your time.

Information provided will be treated as privileged and used only for purposes of statistical description. Summaries will be published after analysis of the results.

Please complete and return the questionnaire promptly. A self-addressed envelope is enclosed for your convenience. Your assistance will be greatly appreciated and, indeed, is essential to the success of this project.

Sincerely yours,

Notest a. alberty

Robert A. Alberty Chairman, Advisory Committee

44

#### SURVEY OF DOCTORAL SCIENTISTS AND ENGINEERS

048 No. 99-573001 Approval expires Dec. 31, 1975

#### CONDUCTED BY THE NATIONAL RESEARCH COUNCIL WITH THE SUPPORT OF THE NATIONAL SCIENCE FOUNDATION.

-- The letter on the adjacent page requests that you assist in this survey of doctoral scientists and engineers - including the fields of the natural and social sciences, mathematics, and engineering.

Please print or type your answers on this first page. If selected information has been printed by computer, check to be cartain the entries are CORRECT and COMPLETE. The second page has special instructions. After the form has been completed, please return it in the enclosed envelope to: Manpower Studies Branch, Office of Scientific Personnel, National Research Council, 2101 Constitution Avenue, Washington, D. C. 20418.

NOTE: ALL INFORMATION IS REGARDED AS CONFIDENTIAL AND WILL BE USED FOR STATISTICAL PURPOSES ONLY. IT WILL NOT BE RELEASED IN ANY WAY THAT WILL ALLOW IT TO BE IDENTIFIED WITH YOU.

## NATIONAL RESEARCH COUNCIL COMMISSION ON HUMAN RESOURCES

2101 Constitution Avenue Washington, D. C. 20418

February, 1977

Dear Colleague,

Perhaps you have seen or heard of the reports on the experience and employment status of Ph.D. scientists and engineers published by the National Academy of Sciences in 1974 and 1976 ("Doctoral Scientists and Engineers in the United States: 1973 Profile." (March, 1974); "1975 Profile." (December, 1976); "Employment Status of Ph.D. Scientists and Engineers: 1973 and 1975." (December, 1976).) These reports summarize data on field of employment, employment status, work activities, and salaries of Ph.D.'s in the work force as of 1973 and 1975. The data are based on the responses of a representative sample of doctoral scientists and engineers.

We are now conducting a new survey to update the 1975 employment and other career-related information. The sample for the 1977 survey has been augmented to include a sample of Ph.D.'s in the humanities as well as recent doctorates in science and engineering. You are a member of the survey sample and we ask for your assistance in providing information which is important not only to doctorate recipients themselves but also to educational organizations and government agencies that fund graduate studies and research.

Please be assured that the National Research Council, along with the three supporting agencies (the National Science Foundation, the National Endowment for the Humanities, and the National Institutes of Health) maintains strict confidentiality of all data. Information is released only in the form of statistical summaries, and no individually identified data is ever divulged.

During the past two years, a great deal of attention has been given to the impact of economic change on Ph.D.'s and to trends in employment, salaries, and career development for this important segment of the population. Your cooperation in the 1977 survey will help to assure that ongoing research in these areas is successful. For your convenience, a pre-addressed, postage paid envelope has been enclosed for the return of your completed questionnaire. Thank you for your assistance.

Sincerely yours,

Robert Q. alberty

The National Research Council is the principal operating agency of the National Academy of Sciences and the National Academy of Engineering to serve government and other organizations

#### **1977 SURVEY OF DOCTORATE RECIPIENTS**

### CONDUCTED BY THE NATIONAL RESEARCH COUNCIL WITH THE SUPPORT OF THE NATIONAL SCIENCE FOUNDATION,

THE NATIONAL ENDOWMENT FOR THE HUMANITIES, AND THE NATIONAL INSTITUTES OF HEALTH THE ACCOMPANYING LETTER requests your assistance in this biennial survey of Ph.D.'s in the humanities, sciences, and engineering. PLEASE READ the instructions for each question carefully and answer by printing your reply or checking the appropriate box. PLEASE CHECK the pre-printed information to be certain that it is correct and complete.

PLEASE RETURN the completed form in the enclosed envelope to the Commission on Human Resources, JH 638, National Research Council, 2101 Constitution Avenue, N.W., Washington, D.C. 20418. NOTE: THIS INFORMATION IS SOLICITED UNDER THE AUTHORITY OF THE NATIONAL SCIENCE FOUNDATION ACT OF 1950, AS

NOTE: THIS INFORMATION IS SOLICITED UNDER THE AUTHORITY OF THE NATIONAL SCIENCE FOUNDATION ACT OF 1950, AS AMENDED. ALL INFORMATION YOU PROVIDE WILL BE TREATED AS CONFIDENTIAL AND USED FOR STATISTICAL PURPOSES ONLY. INFORMATION WILL BE RELEASED ONLY IN THE FORM OF STATISTICAL SUMMARIES OR IN A FORM WHICH DOES NOT IDENTIFY INFORMATION ABOUT ANY PARTICULAR PERSON. YOUR RESPONSE IS ENTIRELY VOLUNTARY AND YOUR FAILURE TO PROVIDE SOME OR ALL OF THE REQUESTED INFORMATION WILL IN NO WAY ADVERSELY AFFECT YOU.

#### Response Rates for the 1977 Survey of Doctorate Recipients in Science, Engineering, and TABLE B.1 the Humanities

The sampling frame includes those deceased, those residing in foreign countries, and those with doctorates in education or professional fields who were working in science or engineering.

The survey sample is the sample size minus persons known to be deceased or out-of-scope prior to the 1977 survey. The out-of-scope classification is assigned to an individual who indicated in a previous survey that he or she:

a) holds a doctorate in education or a professional field and works in a nonscience/nonengineering position, or

b) holds a Ph.D. degree from a foreign institution, is a foreign citizen, and resides in a foreign country.

# The number assumed contacted equals the survey sample minus those individuals for whom no valid

The number assumed contacted equals the survey sample minus those individuals for whom no valid addresses could be obtained.
 \*\* Responses include individuals found to be deceased in the 1977 survey and persons residing in foreign countries in 1977.
 +\* Response rate "A" is the number of 1977 survey responses divided by the number in the survey sample. Response rate "B" is the number of 1977 survey responses divided by the number assumed to have been contacted.

## Individuals who earned doctorates in science, engineering, or the humanities were stratified by field of degree. Those with doctorates in education or professional fields who were identified as working in science or engineering were stratified by field of employment.

\*\*\*Includes only those individuals whose ethnic group was known at the time the sample was selected.

The sampling frame includes those deceased, those residing in foreign countries, and those with doctorates in education or professional fields who were working in science or engineering.

+ The survey sample is the sample size minus persons known to be deceased or out-of-scope prior to the 1975 survey. The out-of-scope classification is assigned to an individual who indicated in a pervious survey that he or she:

a) holds a doctorate in education or a professional field and works in a nonscience/nonengineering position, or b) holds a Ph.D. degree from a foreign institution, is a foreign citizen, and resides in a foreign

country.

The number assumed contacted equals the survey sample minus those individuals for whom no valid

addresses could be obtained. \*\* Responses include individuals found to be deceased in the 1975 survey and persons residing in

 foreign countries in 1975.
 ++ Response rate "A" is the number of 1975 survey responses divided by the number in the survey sample. Response rate "B" is the number of 1975 survey responses divided by the number assumed to have been contacted.

## Individuals who earned doctorates in science and engineering were stratified by field of degree. Those with doctorates in education or professional fields who were identified as working in science or engineering were stratified by field of employment.

\*\*\*Includes only those individuals whose race or ethnic group was known at the time the sample was selected.

# Appendix C Weighting Procedure

Estimates in this report are based on weighted responses. The 4,171 individuals in the total 1977 sample of 83,546 who were known to be deceased or out-of-scope prior to the survey were excluded from the survey and weighted by their sample weight, as were the 1,109 individuals who were known to be deceased prior to the 1973 survey. The responses received from the survey sample (50,648 in 1977 and 41,024 in 1973) were assigned a response weight that is the product of the weight for nonresponse and the sample weight. Table C.1 shows the classification of the 1973 sample and the formulas used for calculating the weights. Table C.2 provides comparable data for 1977.

Each stratum with fewer than two responses was merged with a similarly defined stratum in order to calculate sampling errors. Respondents in each stratum were assigned a weight equal to the integral part plus one. Allocation of weights within a stratum was made at random so as to represent the stratum population. This technique avoids the necessity of rounding fractional estimates of totals.

For example, consider a stratum which contains 60 individuals of whom 15 were selected for the sample. One of the 15 is known to be deceased prior to the survey. This individual receives a sample weight, 60/15, or 4.0, and thus represents 4 individuals in the population. The number of survey sample cases in the stratum is 14. 0f these 14 individuals, 10 responded. The average weight for the respondents in this stratum would be  $[60/15] \cdot [14/10] =$ To obtain integer weights, 4 of the respondents, 5.6. chosen at random, would each receive a weight of 5, thus representing 20 individuals in the population. The 6 remaining respondents would each receive a weight of 6, thus representing 36. Combined, the 10 respondents would represent 56 individuals in the stratum, who together with the 4 individuals who are estimated to be deceased represent the entire 60 individuals in the stratum.

GROUP		Number in Sample	Type of Estimation Weight*

#### TABLE C.2 Classification of Sample and Weighting for 1977 Survey of Doctorate Recipients

\* The sample weights (Ws) and response weights (Wr) for each stratum were computed as follows:

Ws<sub>h</sub> =  $\frac{N_h}{n_h}$ , where N<sub>h</sub> and n<sub>h</sub> are the respective population and m<sub>h</sub> sample sizes of the stratum (h).

 $Wr_h = \frac{N_h}{n_h} \cdot \frac{\hat{n}_h}{r_h}$ , where  $\hat{n}_h$  is the number of survey sample cases in  $r_h$  is the stratum and  $r_h$  is the number of survey responses in that stratum.

- \*\* Based on data obtained through 1973 or 1975 survey responses or through address searches.
- + Based on responses that indicated individuals held Ph.D.'s from foreign
- institutions, were foreign citizens, and resided in foreign countries # Based on responses that indicated individuals held doctorates in education or professional fields and were employed in nonscience/nonengineering positions.

# Appendix D Sampling Error

#### Sampling Error Estimates for Ratios, Proportions, and Differences

Most of the statistics presented in this report are ratios of two weighted sums of observations, i.e., ratios of random variables. Thus we are concerned with a ratio, r = y/x, where  $y = \sum_{h} \left[ N_{h}/n_{h} \right] \sum_{i} y_{hi}$ 

$$x = \sum_{h} [N_{h}/n_{h}] \sum_{i} x_{hi}$$

and where  $y_{hi}$  and  $x_{hi}$  are observations made on the i<sup>th</sup> response of stratum h,  $N_h$  is the number of individuals in the active population of stratum h, and  $n_h$  is the number of responses from stratum h.

The variance of the ratio y/x is estimated by the expression

$$s_{r}^{2} = \left(\frac{y}{x}\right)^{2} \left(\frac{s_{y}^{2}}{y^{2}} + \frac{s_{x}^{2}}{x^{2}} - \frac{2s_{xy}}{xy}\right)$$

where

$$s_{xy} = \sum_{h} \frac{N_{h}^{2}}{n_{h}} \frac{N_{h}^{-n}n_{h}}{N_{h}^{-1}} \frac{1}{n_{h}^{-1}} \left( \sum_{i} \left[ x_{hi} - \bar{x}_{h} \right] \left[ y_{hi} - \bar{y}_{h} \right] \right)$$

ļ

1

 $\overline{x}_h$  and  $\overline{y}_h$  being the means of the x and y values observed in stratum h, respectively. Similarly,  $s_x^2$  and  $s_y^2$  are defined

using  $\left[x_{hi} - \bar{x}_{h}\right]^{2}$  and  $\left[y_{hi} - \bar{y}_{h}\right]^{2}$  in the inner summation.

Some of the statistics in the report are differences between two estimated ratios in percentage form, e.g., the difference between the percentage of engineers employed by business and industry who were working in R&D in 1977 and the corresponding percentage for 1973. If we write the difference as

$$r_1 - r_2 = \frac{y_1}{x_1} - \frac{y_2}{x_2}$$

the variance is estimated by

$$s_{r_1-r_2}^2 = s_{r_1}^2 + s_{r_2}^2 - 2s_{r_1r_2}$$

The terms  $s_{r_1}^2$  and  $s_{r_2}^2$  are estimated variances of ratios, calculated as given above, and  $s_{r_1r_2}$  is estimated by

$$s_{r_1 r_2} = r_1 r_2 \left( \frac{s_{y_1 y_2}}{y_1 y_2} + \frac{s_{x_1 x_2}}{x_1 x_2} - \frac{s_{x_1 y_2}}{x_1 y_2} - \frac{s_{x_2 y_1}}{x_2 y_1} \right)$$

where for example,

$$s_{y_{1}y_{2}} = \sum_{h} \hat{n}_{h} \frac{N_{1h}N_{2h}}{n_{1h}n_{2h}} \frac{1}{\hat{n}_{h}^{-1}} \left( \sum_{i} \left[ y_{1hi} - \bar{y}_{1h} \right] \left[ y_{2hi} - \bar{y}_{2h} \right] \right)$$

and the other covariances are written in similar fashion. In these expressions,  $\hat{n}_h$  is the number of responses in stratum h that are common to the estimates y<sub>1</sub> and y<sub>2</sub>.

These formulas were used to estimate sampling errors for survey statistics published in NRC-CHR report,

<u>Science, Engineering, and Humanities Doctorates in the United</u> <u>States, 1977 Profile</u> (Washington, D.C.: National Academy of Sciences, 1978.). Sampling error estimates were computed as if the responses obtained from a stratum were a random sample from that stratum. Strata were combined whenever the number of responses in a stratum was less than two.

Comparisons were made between sampling errors computed on the basis of a simple random sample (srs) and those which take into account stratification. Table D.1 presents sampling errors associated with selected statistics from the <u>1977</u> <u>Profile</u> report. Bases of various sample sizes and a range of statistic values have been chosen to provide representative comparisons. Sampling errors in the column s<sub>p</sub> were computed by the expression  $\left[\frac{p[1-p]}{n}\right]^{\frac{1}{2}}$ , while those under s<sub>r</sub> were calculated by the formula described above, which takes into account the sample design. The statistics are in percentage form and are the estimated proportion (p) of a variable category with a given characteristic,  $\mathbf{p} = \frac{1}{n} \sum_{i}^{n} y_{i}$  (for the purpose of s<sub>p</sub>), or the ratio of two random variables,  $r = \frac{y}{x}$ (for the purposes of s<sub>p</sub>).

For the most part, differences between the two error estimates are quite small. Calculations based on an srs are for most statistics the same as or slightly higher than those which take account of the stratification. For statistics which are ratios of two stratifying variables (e.g., the ratio of women biological science Ph.D.'s to total biological science Ph.D.'s), the estimate of sampling error is somewhat higher using the formula for  $s_p$ . In certain cases (mainly those involving estimates of type of employer or primary work activity for small subgroups), the use of the formula for an srs appears to underestimate slightly the sampling error.

Table D.2 provides a similar comparison of sampling errors of estimated differences. Sampling errors of differences between two proportions  $(p_1-p_2)$  were computed using the formula

$$s_{p_1 - p_2} = \left\{ \left[ p_1 (1 - p_1)/n_1 \right] + \left[ p_2(1 - p_2)/n_2 \right] - \left[ \frac{2n_c (p_c - p_1 p_2)}{n_1 n_2} \right] \right\}^{\prime z}$$

In this formula,  $p_1$ , and  $p_2$  are the proportions possessing the characteristic in the 1977 and 1975 surveys respectively;  $n_1$  and  $n_2$  are the number of observations from which these proportions were estimated; and  $p_c$  denotes the proportion possessing the attribute in <u>both</u> surveys, estimated from the number of observations  $(n_c)$  common to <u>both</u> surveys.<sup>18</sup>

TABLE D.2 Comparison of Sampling Errors of Differences

<sup>d</sup>Percentage of the total U.S. science and engineering population in each category that was employed full-time. <sup>b</sup>Percentage of the total full-time and part-time employed population in each category that was working in business and industry.

Sampling errors of the differences between two ratios  $(s_{r_1-r_2})$  were computed using the formula discussed above. The data in Table D.2, are drawn from the <u>1977 Profile</u> report and were selected to represent various sample sizes and percentage values.

In most cases, the formula that assumes a simple random sample yields a sampling error estimate close to the estimate computed by strata. Sampling errors of the estimated percentages of various Ph.D. fields who were employed computed  $s_{p1-p2}$  are somewhat lower than those obtained by  $s_{r_1-r_2}$  for four of the seven estimates and much lower in the case of computer sciences. The estimates for this field are extreme values (> 99.0%), based on a relatively small number of observations (< 200).

Sampling error estimates obtained by the formula for an srs are greater than those computed by  $s_{r_1-r_2}$  for the estimated percentages of the population employed full-time or part-time in business and industry. These proportions and ratio estimates take on less extreme values than the estimates of the full-time employed.

The reader should take these potential discrepancies into account when interpreting the sampling errors of statistics presented in this report. These sampling error estimates were obtained using the formulas for simple

random samples discussed above. Table D.3 summarizes sampling errors associated with various proportion values and sample sized.

Values in Table D.3 were computed using the formula  $s_{p} = \left[\frac{p[1-p]}{n}\right]^{\frac{1}{2}}$ , in which p is the proportion of a particular category (variable) possessing a certain characteristic,  $y\left(i.e., p = \frac{1}{n}\sum_{i}^{n}y_{i}\right)$ , and n is the number of sample members in the variable-specified category (e.g., doctoral scientists and engineers in the U.S. labor force) who responded to the survey. The finite population correction factor, fpc =  $\left[[N-n] / [N-1]\right]^{\frac{1}{2}}$ , has been omitted from the calculations, since the fpc has negligible effect on most statistics in this report, unless the estimate applies to a subgroup that has a high sampling rate. In any case, the omission of the fpc in the formula for s<sub>p</sub> yields a conservative estimate (i.e., a higher estimate) of the sampling error.

The estimated sizes of population and population subgroups are provided in the tables in the body of the report. The sample sizes on which these population estimates were based can be approximated by multiplying the population by the weighting fraction, which is the sampling fraction corrected for nonresponse. Weighting fractions for selected groups are provided in Table D.4.

Example: In Table 3B, the estimated population of doctoral scientists and engineers employed in business and industry is 70,600. Multiplying by .112, the approximate sample size is 7,907. The sampling error of a reported statistic (for instance, 22.5 percent employed in management and administration of R&D) can be estimated by the formula for s<sub>n</sub> or by consulting Table D.3 using rough approximations of the sample size and percentage in proportion form. In this case  $s_p = \left(\frac{0.225 \ [1-0.225]}{7,907}\right)^{\frac{1}{2}} = 0.00470$  or approximately 0.5 Similarly, the value in the table opposite 8,000 for percent. 0.25 is 0.005, or 0.5 percent. The reader can construct the desired confidence interval by multiplying the standard error by the approriate coefficient:  $\pm$  ls<sub>n</sub> will provide a 66.7 percent confidence interval,  $\pm 2s_{p}$  approximately a 95 percent interval. etc.

### Sampling Error Estimates for Medians<sup>19</sup>

Sampling errors of median salary estimates presented in this report were computed not by strata but for all observations n, the number of full-time employed individuals in a particular subgroup who reported a salary. Comparisons

<sup>&</sup>lt;sup>1</sup> The method for determining sampling errors of medians in this report was adapted from Morris H. Hansen, William N. Hurwitz, and William G. Madow, <u>Sample Survey Methods and</u> <u>Theory</u>, vol. 1 (John Wiley & Sons, Inc., New York, 1953), pp. 448-449.

of sampling errors for ratios, proportions, and differences indicate minor differences for the most part, between those calculated by strata and those that do not fully take into account sample design. The reader should interpret the confidence intervals as close approximations.

From the estimated population distribution, a statistic, m is computed that is an estimator of M, the position measure (median, quartile, decile, etc.). When m is a median,  $p_m$  the proportion of cases in the derived distribution falling below the position measure equals 0.5. The sampling error of  $p_m$  is estimated by the formula

 $s_{p_{m}} = \left(\frac{p_{m}[1-p_{m}]}{n}\right)^{\frac{1}{2}}$ . Two additional proportions are then computed:  $p_{1} = p_{m} - ks_{p_{m}}$ 

$$p_2 = p_m + ks_{p_m}$$

The confidence interval for the median is set by calculating  $m_1$  and  $m_2$ , the values below which the proportions  $p_1$  and  $p_2$  of the estimated distribution fall. The level of confidence is determined by k and will be 66.7 percent when k = 1, approximately 95 percent when k = 2, etc.

The 95 percent confidence intervals for selected categories of Ph.D. scientists and engineers employed in business and industry are presented in Table D.5.

#### Nonresponse Bias

In addition to sampling error, survey estimates are subject to a number of nonsampling errors, including misinterpretation of survey questions, errors in coding and processing of responses, incomplete sampling frame, and bias due to nonresponse. A recently published study<sup>2</sup> of the effects of nonresponse bias on data from the 1975 Survey of Doctorate Recipients concluded that although evidence of nonresponse bias was detected for certain employment and demographic characteristics, data published in the <u>1975 Profile of Doctoral Scientists and Engineers</u> in the United States do not appear to be seriously affected.

Although the nonresponse bias study was confined to 1975 survey data, it is reasonable to assume that because the sample is longitudinal major findings are valid for the 1973 and 1977 survey results as well. The most serious bias detected was a lower percentage of foreign residents in the response group than in the nonresponse group. This bias resulted in an overestimation , 6-7 percent, of the sizes of the doctoral science and engineering population and labor force in the United States. A related bias was also discovered in the underestimation of the percentage of foreign citizens in the U.S. science and engineering population. The study found that the proportion of fulltime and part-time employed doctoral scientists and engineers who were working in business and industry was slightly underestimated.

These nonresponse biases suggest that estimates of the number of doctoral scientists and engineers employed in business and industry in 1973 and 1977 are slightly higher than the actual figures. Of course, countervailing biases are possible, such as those resulting form the lack of a comprehensive sampling frame for Ph.D. recipients who earned their degrees at foreign institutions and who may be working in the United States.

<sup>20</sup> National Research Council, Commission on Human Resources, <u>The Effects of Nonresponse Bias on the Results of the 1975</u> <u>Survey of Doctoral Scientists and Engineers</u> (Washington, D.C.: National Academy of Sciences, 1979), p. 33.

### Appendix E Estimation Procedure for Tables 12 and 13

The estimation of Tables 12 and 13 proceeded in several steps. The first step was to estimate the number of Ph.D.'s that were in the labor force in both years, 1973 and 1977. Two estimates are available, one based on the weights associated with the 1973 survey and the other based on the weights associated with the 1977 survey. Since these two estimates have approximately the same variance, an improved estimate is the simple mean of the 1973 and 1977 estimates.

The next stage was to adjust the 1973 and 1977 distributions by type of employment to the estimated total labor force. This adjustment is a ratio estimate, of the form  $\mathbf{x_j} = (\mathbf{x_j}/\Sigma \mathbf{x_j})\mathbf{t}$ , where  $\mathbf{x_j}$  is the original estimate for class j in the given year and t is the estimated total labor force. The adjusted values then become the marginal totals of Table 12, whose cells initially contain estimates using the weights associated with the 1977 survey. However, the cells do not, in general, sum to either of the marginal totals.

The cells of Table 12 are then adjusted to sum to the row totals by a ratio estimate of the same form as that given above; i.e., the adjusted figure for the cell in the i-th row and j-th column is given by  $\mathbf{x'} = (\mathbf{x_{ij}} / \sum_{j=1}^{T} \mathbf{x_{ij}})^{t_{i}}$ , where  $\mathbf{x_{ij}}$  is the figure in the cell and  $\mathbf{t_{i}}$ . is the marginal total for the i-th row. The adjustment is then made to column totals in a

similar way, namely  $\mathbf{x}' = (\mathbf{x}_{ij} / \sum_{i} \mathbf{x}_{ij}) \mathbf{t}_{i}$ 

It has been shown that iteration of the adjustment to row and column totals converges, and that the result has attractive statistical properties. These include the property that the procedure provides estimates which minimize discriminant information and that the resulting estimates are best asymptotically normal estimators, conditional on the marginal totals.

The procedure for Table 13 followed the same steps, after fixing the total number employed in business and industry as given by the final adjustment of Table  $12.^{21}$ , <sup>22</sup>

# Appendix F Supplementary Tables

#### Ph.D. Granting Institutions and Field of Doctorate

Table F.1 shows the top 25 institutions, in terms of the number of Ph.D. degrees awarded, for scientists and engineers employed in business and industry. These 25 U. S. educational institutions graduated almost half (46.8 percent) of the doctoral scientists and engineers employed in business and industry in 1977. The University of Illinois at Champaign-Urbana and the Massachusetts Institute of Technology (MIT) graduated the largest numbers of science and engineering Ph.D.'s who were employed in business and industry in 1977 (over 2,300 from each school).

Of those Ph.D.'s employed in business and industry, by far the highest percentages held degrees in chemistry (30 percent) and engineering (29 percent). The 25 universities listed in Table E.l awarded 43.2 percent of the doctorates in chemistry and 49.3 percent of those in engineering, with the remainder granted by other U.S. institutions and foreign institutions. Nearly 10 percent of the Ph.D. degrees held by engineers who were employed in business and industry were earned at two universities, MIT and Stanford.

Fewer than 20 institutions awarded over 70 percent of doctoral degrees in computer sciences. Further, just four schools, the University of Wisconsin at Madison, the University of Michigan, the University of Illinois at Urbana, and Stanford University, awarded nearly 30 percent of the Ph.D.'s in this field.

Three schools granted over 20 percent of the doctoral degrees hald by all agricultural scientists working in business and industry: Iowa State (8.7 percent), Michigan State (6.9 percent), and the University of Illinois at Urbana (6.6 percent). High percentages of medical science doctorates were granted by the University of Minnesota (9.2 percent), Purdue University (8.7 percent), and the University of Wisconsin at Madison (8.5 percent). Several Eastern schools awarded high percentages of Ph.D.'s earned in the social sciences: New York University (6.2 percent), Columbia University (5.2 percent), and Harvard University (5.2 percent).

**TABLE F.1** Number of Doctoral Scientists and Engineers Employed in Business and Industry in 1977 byPh.D. Granting Institution and Field of Doctorate

# FINE FIELDS OF EMPLOYMENT AND DETAILED BUSINESS AND INDUSTRY GROUPS

Tables F.2 and F.3 present estimates of the number of doctoral scientists and engineers employed in business and industry in 1977 by their specific business and industry groups and their fine field of employment. These tables provide a detailed breakdown of the broad employment categories that were aggregated in the multivariate crosstabulations presented in the body of the report. The threedigit SEC Industry Codes (based on SIC) are given in Table F.2 followed by the SIC classification of business and industry groups. Three-digit codes in Table F.3 correspond to the Degree and Employment Specialties List that is part of the 1977 questionnaire in Appendix A.

Detailed Bus. and Ind. Group	No. Employed	SEC Ind. Code <sup>a</sup>
Total	70618	
Manufacturing	50726	
Food & Allied Products	1680	201 to 209
Textiles & Apparel	272	221 to 239
Lumber, Wood Prod, Furn	280	241, 251
Paper & Allied Products	718	262 to 265
Chemicals & Allied Products	17685	281 to 289
Industrial Chemicals	10752	281
Drugs & Medicines	5445	283
Other Chemicals	1488	284 to 289
Petrol Refining & Extraction	5400	131 to 139, 291 to 299
Rubber Products	753	301 to 309
Stone, Clay, & Glass Prod.	962	321 to 327
Primary Metals	1210	331, 335
Ferrous Metals & Prod.	492	331
Nonferrous Metals & Prod.	718	335
Fabricated Metal Products	586	341 to 349
Machinery	3494	351 to 358
Office Comp & Acct Mach.	2537	357
Other Machinery	957	351 to 356, 358
Elec. & Comm. Equip./Comm.	8231	363 to 369, 481 to 489
Comm Rec Equip, Elec Comp	2641	366
Communication	2324	481 to 489
Other Electrical Equip.	3266	363, 369
Transportation Equipment	5022	371 to 379
Motor Vehicles & Equip.	1719	371
Aircraft & Missiles	3223	372
Other Trans. Equip.	8	373 to 379
Professional & Sci. Equip.	3855	381 to 387
Sci & Mech Measuring Inst	1039	381, 382
Optic, Med, Photo, Oth Ins	2816	383 to 387
Other Manufacturing Industr.	650	211, 219, 271, 275, 311 to 319, 391 to 399
Nonmanufacturing	7344	
Agric, Forestry & Fisheries	375	011 to 021
Mining (Excl Petrol & Gas)	162	100 to 120, 140
Contract Construction	634	150 to 171
Transportation & Utilities	666	400 to 478, 491 to 499
Wholesale & Retail Trade	572	501 to 599
Finance, Insurance, Real Est	1017	601 to 679
Services	3918	701 to 899
Non-Classifiable Companies	5714	991
Self-Employed	6834	(identified from survey
		response)

TABLE F.2Number of Doctoral Scientists and Engineers Employed in Business andIndustry by Detailed Business and Industry Group, 1977

<sup>a</sup>The SEC industry code is an adaptation of the Enterprise Standard Industrial Classification (SIC), which was developed by the Office of Management and Budget, Executive Office of the President. The complete coding system follows on pp. 84-88, which reproduce pp. iv-viii of the Directory of Companies Required to File Annual Reports with the Securities and Exchange Commission, Washington, D.C.: Securities and Exchange Commission, 1977.

### SIC INDUSTRY CODES

.

- -

SEC Industry Code Mo.		Corresponding Establishment SIC Code No.
1.	AGRICULTURE, PORESTRY AND FISHERIES (\$6)	
011 013 021	Field crops Fruits, tree nuts and vegetables Livestock	011, 071, 072, 076, 078 013-019, 081-085 021-029, 074, 075, 091-097
11.	MINING (757)	
100 108	Netal mining Netal mining - nonproducers	101-106, 109 108
120	Coal mining	111, 121
131 138	Crude petroleum extraction and natural gas Oil and gas field services	131, 132 138
139	Crude petroleum and natural gas - nonproducers (exploration & drilling funds)	-
140	Nonmetallic minerals	141, 142, 144, 145, 147-149
111.	CONTRACT CONSTRUCTION (105)	
150 160 171	General building contractors Heavy construction contractors Special trade contractors	152-154 161-162 171-179
IV.	NANUFACTURING (3577)	
201 202 203 204 205 206	Neat products Dairy products Canned, cured and frozen foods Grain mill products Bakery products Bakery products	201, 207 202 203, 209 204 205 205 206
208 209	Alcoholic and malt beverages Bottled soft drinks and flavorings	2082-2085 2086-2087
211 219 221	Cigarettes Tobacco manufactures, n.e.c. Weaving and finishing mills; yarn and thread mills; miscellaneous textile mill products	211 212-214 221-224, 226,
225 227	Knitting mills, includes knitted apparel Floor covering mills	228, 229 225 227
231 239	Apparel, except knitted apparel Miscellaneous fabricated textile products	231-238 239

SEC Industry Code No.		Corresponding Establishment SIC Code No.
241	Lumber and Wood products, except furniture	241-245, 249
251	Furniture and fixtures	251-254, 259
262	Pulp, paper and board	261-263, 266
264	Miscellaneous converted paper products	264
265	Paperboard containers and boxes	265
271	Newspapers, periodicals and books - publishing,	
	or publishing and printing	271, 272
		2731, 274
275	Printing and allied industries	2732, 275-279
281	Basic chemicals, plastics materials, and	
	synthetics	281, 282
283	Drugs	283
284	Soap, cleaners, and toilet goods	284
285	Paints and allied products	285, 2893 287
287 289	Agricultural chemicals Chemical products, n.e.c.	286, 289
209	chamilar products, n.e.c.	(except 2893)
291	Petroleum refining	291
299	Petroleum and coal products, n.e.c.	295, 299
301	Tires and inner tubes	301
309	Rubber and plastic products, n.e.c.	302-304, 306, 307
311	Leather tanning and finishing	311
314	Footwear, except rubber	314
319	Leather and leather products, n.e.c.	313, 315-317, 319
321	Glass products	321-323
324	Cement, hydraulic	324
325	Structural clay products	325
327	Concrete, gypsum and plaster products and non- metallic mineral products, n.e.c.	326-329
331	Iron and steel - blast furnaces, steel mills,	
JJ 4	and iron and steel foundries	331, 332
335	Nonferrous metals - refining, rolling, drawing and nonferrous foundries	333-339
341	Metal cans and shipping containers	341
342	Cutlery, hand tools, and hardware	342
343	Plumbing and heating, except electical	343
345	Screw machine products, bolts, etc.	345 348
348 349	Ordnance, except vehicles and guided missiles	344, 346, 347, 349
	Pabricated metal products, n.e.c.	
351 352	Engines and turbines Farm machinery construction mining and	351
554	Farm machinery, construction, mining and materials handling machinery	352, 353
354	Metalworking machinery	354
	Special industry machinery	355
	General industrial machinery	356, 359
357	Office and computing machines	357
358	Service industry machines	358

SEC Industry Code No.		Corresponding Establishment SIC Code No.
363	Household appliances	363
366	Radio, television, communication equipment, and	
369	electronic components and accessories Electrical lighting and wiring equipment,	365-367
	transmission and distribution equipment, and	
	electrical machinery, n.e.c.	361, 362, 364, 369
371	Motor vehicles and equipment, including rebuilt	
	parts	371
372	Aircraft, guided missiles and parts	372, 376
373 374	Ships and boat building and repairing Railroad equipment	373 374
379	Transportation equipment, n.e.c.	375, 379
		•
381	Scientific instruments and mechanical measuring devices	381, 382
383	Optical and opthalmic goods, photographic	501, 501
